Description

Background

As part of Block 1 (Sales Invoice) of the Statrys accounting feature, clients need to register the customers they invoice. Adding a client must feel effortless and connected to the rest of the app, so clients can reuse data they already have on the business-account/payment side rather than re-typing it.

Goal

Let a client create a new client record — from the Client List or from within an invoice — by either prefilling from an existing Statrys payment contact or typing fresh, with validation and duplicate protection.

Acceptance Criteria

1. Open the Add Client form from either entry point

GIVEN a client is on the Client List screen or on an Invoice form
WHEN they select "Add Client" / "New Client"
THEN the system displays the Add Client Form with all fields empty
AND the form records which entry point it was opened from (Client List or Invoice)

1. Choose how to populate the form

GIVEN the Add Client Form is open
WHEN the client chooses to prefill from an existing Statrys payment contact
THEN the system lets them search and select a payment contact and auto-fills the matching fields, all of which remain editable
AND if they instead choose to type fresh, the form stays empty for manual entry

1. Validate fields on Save

GIVEN the client has entered client details
WHEN they select "Save"
THEN the system validates all required fields and field formats (see Client Field Specification below)
AND if any check fails, the system shows an inline error on each offending field and does not save

1. Detect possible duplicates

GIVEN the entered Company Name or Email matches an existing client record
WHEN the client selects "Save"
THEN the system shows a "possible duplicate" warning identifying the existing record
AND the client may cancel to reuse the existing record, or confirm to save the new record anyway

1. Save success — behaviour depends on entry point

GIVEN all validation passes (and any duplicate warning is confirmed)
WHEN the system saves the client record
THEN the system persists the record and behaves according to the entry point (see Post-Save Behaviour below)
AND a success confirmation is shown

1. Save failure is recoverable

GIVEN the client has selected "Save"
WHEN the save fails due to a network or backend error
THEN the system shows a clear error message
AND retains everything the client entered
AND offers a retry without re-entering data

Rules

Client Field Specification

Field	Field Type	Data Format	Required	Notes
Company Name	Textbox	String	Yes	
First Name	Textbox	String	No	Contact name
Last Name	Textbox	String	No	Contact name
Company Registration Number	Textbox	String	Yes	
Email Address	Textbox	Valid email format	Yes	Company / contact email
Phone Number	Textbox	Valid phone format	Yes	Encrypted in transit and at rest
Website	Textbox	Valid website format	No	
Address	Textbox	String	Yes	
City	Textbox	String	Yes	
State	Textbox	String	No	Free text; optional
Zip / Postal Code	Textbox	String	Yes	
Country	Dropdown	Country list	Yes	
Currency	Dropdown	Currency list	No	Default invoice currency; dropdown prioritises the currencies the client already holds on the account side

Post-Save Behaviour by Entry Point

Entry Point	On Successful Save
Client List	New client appears in the Client List; user lands on / returns to the Client List
Invoice form	New client is added to the Client List and auto-selected into the current invoice ; user remains on the Invoice form

Duplicate Matching

Match Condition	System Action
Company Name matches an existing client	Warn, allow override
Email matches an existing client	Warn, allow override

Notes

- Surface: client side is the **mobile app**; the Operation Manager **back office is web**. Both surfaces can add clients **and** both support prefill-from-contact.
- Prefill source is **Statrys payment contacts**. A client record is the **same synced record** shared with the payment/contacts side; records can also originate from external bank statements the client uploads.
- De-duplication of a prefilled contact is **not** performed at creation — it is resolved later, when the client uploads an invoice and a transaction is matched to a payee (handled in the invoice-upload / reconciliation flow).
- No character limits / max lengths apply to text fields.
- Phone Number must remain **encrypted** (in transit and at rest).
- Out of scope for this story: invoice creation itself, reconciliation/payment matching, and the bank-statement upload/parsing flow (separate stories in Block 1).
