Description

Background

Clients often issue sales invoices outside Statrys (their own templates, other tools). In Block 1, they need to bring those invoices into the app by uploading a file, letting OCR extract the details, and tracking the invoice through the same status lifecycle so it can be reconciled against incoming payments.

Goal

Let a client upload an existing sales invoice, have OCR map it to invoice fields for review, then issue and resolve it through its status lifecycle — with the invoice number taken from the user's input rather than system-generated.

Acceptance Criteria

1. Upload an invoice file

GIVEN a client is on the invoice list
WHEN they select "Upload Invoice" and select or drag a file into the upload area
THEN the system accepts a PDF, JPG, or PNG within the size limit (see File Constraints below)
AND rejects an unreadable, oversized, or unsupported file with a clear reason

1. Extract details by OCR for review

GIVEN a valid uploaded file
WHEN the system reads it and maps fields by OCR
THEN it creates an invoice in **Draft** status (editable) pre-filled with the extracted values for the client to review and edit
AND low-confidence fields are flagged for the client to verify, and other OCR problems are handled per the OCR Failure Handling table below
AND a Draft invoice can be deleted (removed from system); deletion is only available in Draft

1. Issue the invoice using the user-entered invoice number

GIVEN a reviewed draft uploaded invoice
WHEN the client selects "Create" / issue
THEN the system uses the **invoice number from the user's input** (not system-generated), validates required fields, and moves the invoice to **Awaiting Payment**
AND if that invoice number already exists, the system warns of the duplicate but allows the client to override

1. Send is optional

GIVEN an uploaded invoice in Awaiting Payment
WHEN the client reviews sending options

THEN the default is **record-only** (the invoice was sent another way)
AND the client may optionally send it from the app (email PDF and/or shareable link)

1. **Cancel an issued invoice with a Credit Note**

GIVEN an uploaded invoice in Awaiting Payment or Overdue status
WHEN the client selects "Cancel with Credit Note" and completes the Credit Note flow
THEN the invoice moves to **Void** (non-editable)

1. **Reconcile against a payment**

GIVEN an issued invoice and incoming transactions on the payment side
WHEN the system auto-suggests a matching transaction and the client confirms the match
THEN the system sets the status based on the matched amount (see Reconciliation Outcomes below)
AND a fully matched invoice becomes **Paid** (non-editable)

Rules

File Constraints

Constraint	Rule
Accepted file types	PDF, JPG, PNG
Maximum file size	10 MB (default — to confirm)
Unreadable / corrupt / unsupported file	Reject at upload with a clear error

OCR Failure Handling

Scenario	System Behaviour
Nothing extracted	Show an error; let the client enter details manually or re-upload
Low-confidence fields	Flag those fields for the client to verify before issuing
Mis-mapped fields	Client corrects them in the review/edit step
Unsupported / unreadable file	Reject at upload (see File Constraints)

Duplicate Invoice Number

Condition	System Action
User-entered invoice number already exists	Warn, allow override

Invoice Status Matrix

Status	Editable?	Entered When	Deletable?	Terminal?
Draft	Yes	After OCR, before issuing	Yes	No
Awaiting Payment	Limited	Invoice issued	No	No
Overdue	Limited	Awaiting Payment and due date has passed, unpaid (client is notified)	No	No
Partially Paid	No	Reconciliation matches a payment less than the total	No	No
Paid	No	Reconciliation matches the full total (or overpayment)	No	Yes
Void	No	Cancel with Credit Note completed	No	Yes

Reconciliation Outcomes

Matched Amount vs Invoice Total	Resulting Status
Equal to total	Paid
Less than total	Partially Paid (remainder still due)
Greater than total	Paid, with the overpayment flagged for review (credit/refund)

Notes

- Surface: client side is the **mobile app**; the Operation Manager **back office is web**.
- Key difference from the created-invoice flow (STORY3_create_sales_invoice.md): invoice number is **user-entered, not system-generated**, and sending defaults to **record-only**.
- **Editing an issued invoice** is limited: if it was sent from the app, the edit regenerates and re-sends the document; if it is record-only, the edit just updates the stored record.
- **Overdue** notifies the Statrys client (the sender) only.
- **Reconciliation** here is covered at the status-outcome level; the detailed transaction-matching mechanism is a separate story.
- Out of scope: the Credit Note flow itself, and overpayment resolution mechanics (credit note vs refund).

Things Not Clear

- **Maximum file size** confirmation (defaulted to 10 MB).
- Which exact fields make up the **"limited edits"** set allowed on an issued invoice (shared with STORY3_create_sales_invoice.md).
