Description

Background

Client details change over time (address, contact, registration number, currency). In Block 1 (Sales Invoice) of the Statrys accounting feature, client must be able to update a client record and have those changes flow into the right invoices without corrupting invoices that are already finalised.

Goal

Let a client edit an existing client record from a pre-filled form, with validation, duplicate protection, controlled propagation to draft and future invoices, and safe handling of concurrent edits.

Acceptance Criteria

1. Open the pre-filled Edit form

GIVEN a client selects "Edit" on an existing client from the Client List
WHEN the Edit Client Form opens
THEN the system displays the form pre-filled with the client's current details, all editable
AND Edit is available only from the Client List, not from within an invoice
AND if the client navigates away with unsaved edits, the system warns them before discarding

1. Validate changes on Save

GIVEN the client has changed one or more fields
WHEN they select "Save"
THEN the system validates all required fields and field formats (same rules as the Add Client story)
AND if any check fails, the system shows an inline error on each offending field and does not save

1. Detect possible duplicates on changed identity fields

GIVEN the edited Company Name or Email now matches another existing client record
WHEN the client selects "Save"
THEN the system shows a "possible duplicate" warning identifying the other record
AND the client may cancel, or confirm to save anyway

1. Propagate changes to the correct invoices

GIVEN the client record is saved successfully
WHEN the system applies the updated details
THEN it updates all **draft** invoices and all **future** invoices for that client, and does **not** change any finalised / sent / paid invoice (see Invoice Propagation Matrix below)
AND a changed default **Currency** applies only to new invoices — existing draft invoices keep their original currency (currency is locked once an invoice exists)

1. Handle concurrent edits with a conflict warning

GIVEN the same client record has been edited on the mobile app and the web back office at the same time
WHEN the second user selects "Save"
THEN the system warns them that the record changed since they opened it and asks them to confirm before overwriting
AND on confirm, the most recent save is applied (last-write-wins) and a field-level audit entry is recorded (before/after, user, timestamp), visible to the Operation Manager back office

1. Save failure is recoverable

GIVEN the client has selected "Save"
WHEN the save fails due to a network or backend error
THEN the system shows a clear error message
AND retains all edits
AND offers a retry without re-entering data

Rules

Invoice Propagation Matrix

Invoice Status	Updated with new client details?
Draft	Yes (except Currency — see below)
Future / new (created after the edit)	Yes
Sent / finalised	No
Paid	No

A changed default **Currency** does not alter existing draft invoices — currency is locked once an invoice exists, and the new default applies only to invoices created after the change.

Editable Field Specification

Same field set, formats, and required flags as the Add Client story — see "Client Field Specification" in STORY1_add_new_client.md. Country remains a dropdown; State is free text and optional; Phone Number remains encrypted.

Notes

- **Edit entry point: Client List only.**
- Surface: client side is the **mobile app**; the Operation Manager **back office is web**. Both can edit; edits sync to the single shared client record.
- The client record is the **same synced record** used by the payment/contacts side; an edit here is an edit everywhere that record is referenced.
- **Audit trail:** field-level before/after with user and timestamp, visible to the Operation Manager back office.
- Out of scope for this story: deleting/archiving a client, invoice creation, and reconciliation/payment matching.
